Received 21 November 1997, in final form 10 March 1998

Abstract. We investigate thermodynamical properties of four- and five-dimensional black-hole solutions of toroidally compactified string theory. We find an explicit expression for the first law of black-hole thermodynamics. We calculate the temperature $T$, angular velocity $\omega$ and the electromagnetic potentials $\mathbf{A}_i$ on the horizon using two different methods.

1. Introduction

The connection between black-hole mechanics and thermodynamics is one of the most interesting developments in the past 30 years. The first law of black-hole mechanics, as proved by Bardeen et al [1], gives the variation of mass in terms of the variations in area and angular momentum. This relationship opened the way for the area of the black hole to be interpreted as its entropy and the surface gravity as its temperature.

With the discovery of the Hawking radiation, it was understood that the close parallel between the laws of thermodynamics and black-hole mechanics was more than a coincidence and had a physical basis. Black holes radiate with a black-body spectrum at the temperature given by surface gravity.

Hawking radiation, while answering an important question, raised new ones like information loss, black-hole evaporation and the microscopic origin of black-hole entropy.

In this paper, I am interested in finding the explicit form of the first law of black-hole mechanics for two different black holes. In other words, given the metric, I want to find the coefficients $T$, $\omega$ and $\mathbf{A}_i$ in

$$dM = T \, dS + \omega \cdot dJ + \mathbf{A}_i \, dQ_i. \quad (1)$$

If we have a black-hole solution, we can easily calculate the surface area of the outer horizon using the metric components. Entropy is given by $S = (1/4G_N)A$. Then, if the algebraic equations are tractable, we can isolate $M$, take derivatives, and obtain the first law.

This procedure will not work if the solution is given in terms of parameters that cannot be solved explicitly in terms of mass and charges. Then we have to use a roundabout

† E-mail address: sermutlu@cvetic.hep.upenn.edu
way, using infinitesimal variations to make a change of variables, which in general involve inverting a big matrix, and if all entries are non-zero, the results may be too complicated.

We expect the variation of mass with respect to area to be the temperature of the black hole, and the variation of mass with respect to angular momentum to be the angular velocity. These quantities can be computed from the metric. This will be an independent way to calculate the coefficients in the first law, and will provide a check on the results.

In this paper, we will follow the summarized procedure for two different types of black hole, corresponding to four- and five-dimensional solutions of toroidally compactified string theory. We first write the area in terms of solution parameters, take the infinitesimal variation of the area, and replace the solution parameters by the physical ones using the Jacobian matrix. Then we calculate $\cdot$ and $\kappa$ using the metric, and compare the results with the first law.

I have also tried to obtain Smarr’s formula [2], but we do not know the mass as an explicit function, so Smarr’s procedure of using Euler’s theorem to obtain $M = 2TA + 2\cdot J + 8Q$ is not applicable in this case.

In section 2, a four-dimensional rotating black hole parametrized by ADM mass, four charges, and angular momentum [3] will be analysed, and in section 3 we consider a fivedimensional black hole with two angular momenta and three charges [4].

2. Four dimensions

2.1. The metric and physical parameters

The metric for four-dimensional rotating charged black-hole solutions of toroidally compactified superstring theory, parametrized by the ADM mass, four charges and angular momentum, is given by [3]

$$s_E^2 = \sqrt[\Delta]{r^2 - 2mr + l^2 \cos^2 \theta} \left[ dt^2 + \frac{dr^2}{r^2 - 2mr + l^2} + d\theta^2 + \frac{\sin^2 \theta}{\Delta} \left\{ (r + 2m \sinh^2 \delta_1)(r + 2m \sinh^2 \delta_2)(r + 2m \sinh^2 \delta_3) \times (r + 2m \sinh^2 \delta_4) + l^2 (1 + \cos^2 \theta)r^2 + W + 2ml^2 r \sin^2 \theta \right\} d\phi^2 - \frac{4ml}{\Delta} \left\{ (\cosh \delta_1 \cosh \delta_2 \cosh \delta_3 \cosh \delta_4 - \sinh \delta_1 \sinh \delta_2 \sinh \delta_3 \sinh \delta_4) r + 2m \sinh \delta_1 \sinh \delta_2 \sinh \delta_3 \sinh \delta_4 \right\} \sin^2 \theta \ dt \ d\phi \right\},$$

where

$$1 = (r + 2m \sinh^2 \delta_1)(r + 2m \sinh^2 \delta_2)(r + 2m \sinh^2 \delta_3)(r + 2m \sinh^2 \delta_4)$$

$$+ (2l^2 r^2 + W) \cos^2 \theta,$$

$$W = 2ml^2 (\sinh^2 \delta_1 + \sinh^2 \delta_2 + \sinh^2 \delta_3 + \sinh^2 \delta_4)r$$
The first law of black-hole thermodynamics

\( + 4m^4(l^2(2 \cosh \delta_1 \cosh \delta_2 \cosh \delta_3 \cosh \delta_4 \sinh \delta_1 \sinh \delta_2 \sinh \delta_3 \sinh \delta_4) \) (3)

\(- 2 \sinh^2 \delta_1 \sinh^2 \delta_2 \sinh^2 \delta_3 \sinh^2 \delta_4 \) \— \sinh^2 \delta_1 \sinh^2 \delta_2 \sinh^2 \delta_3 \sinh^2 \delta_4 \)

\(- \sinh^2 \delta_1 \sinh^2 \delta_2 \sinh^2 \delta_3 \) \— \sinh^2 \delta_2 \sinh^2 \delta_3 \phi_4 \)

\(- \sinh^2 \delta_1 \sinh^2 \delta_2 \sinh^2 \delta_3 \sinh^2 \delta_4 \)

\(- \sinh^2 \delta_1 \sinh^2 \delta_3 \sinh^2 \delta_4 \phi_4 \) \— \(l^4 \cos^2 \theta.\)

The outer and inner event horizons are at

\[ r_+ = m \pm \sqrt{m^2 - l^2}, \quad (4) \]

Note that we choose \( G_N = \frac{1}{4} \pi \).

2.2. The first law of black-hole thermodynamics

The entropy is given by \( (1/4G_N)A \) where \( A \) is the area of the outer horizon. In this case, \( S \) has the form \([3]\):

\[ S = 16 \pi \left[ \left( m^2 + m \sqrt{m^2 - l^2} \right) \left( \cosh \delta_1 \cosh \delta_2 \cosh \delta_3 \cosh \delta_4 \right) \right. \]

\[ \left. + \left( m^2 - m \sqrt{m^2 - l^2} \right) \left( \sinh \delta_1 \sinh \delta_2 \sinh \delta_3 \sinh \delta_4 \right) \right]. \quad (6) \]

We can write the variation of entropy in terms of the solution parameters as follows:

\[ \frac{dS}{d} = \frac{\partial S}{\partial \delta_1} d\delta_1 + \frac{\partial S}{\partial \delta_2} d\delta_2 + \frac{\partial S}{\partial \delta_3} d\delta_3 + \frac{\partial S}{\partial \delta_4} d\delta_4 + \frac{\partial S}{\partial m} dm + \frac{\partial S}{\partial l} dl, \quad (7) \]

but we want to write the variation in terms of the physical parameters:

\[ dS = 0_1 dQ_1 + 0_2 dQ_2 + 0_3 dP_1 \left( + 0_4 dP_2 \right) + 0_5 dM + 0_6 dJ, \quad (8) \]

where

\[ m, \quad \text{the non-extremality parameter, is related to the mass of the Kerr solution,} \]

\[ l \text{ is related to the angular momentum of the Kerr solution and} \]

\[ \delta_1, \delta_2, \delta_3, \delta_4 \text{ are boost parameters. Our aim is to} \]

\[ \text{write the variation of} \quad S \quad \text{in terms of the physical parameters} \]

\[ \text{ADM mass} \quad M, \quad \text{two electric charges} \quad Q_1, Q_2, \quad \text{two magnetic charges} \quad P_1, P_2, \quad \text{and the angular momentum} \quad J. \]
To find the 0′s, we need the derivatives of the solution parameters (δ′s etc) with respect to the physical parameters (Q′s etc). We cannot invert equation (5), so we cannot find the solution parameters explicitly in terms of the physical parameters. But we can always find the infinitesimal variations by inverting the Jacobian matrix. The details of this lengthy but straightforward calculation are in appendix A.

Thus, we can find the coefficients in (10) in terms of S as:

\[ T = \frac{4\sqrt{m^2 - l^2}}{S}, \]

\[ \Omega = \frac{8\pi l}{S}, \]

\[ \Phi = \frac{S_i}{S}. \]

In [2] Smarr obtained the formula \( dM = T \, dA + \, dJ + 8dQ \) and from this, using the fact that \( M \) is homogeneous of degree \( \frac{1}{2} \) in \((A, L, Q^2)\), he obtained

\[ M = 2TA + 2J + 8Q. \]  

However, we are not in a position to repeat this, because we cannot express \( M \) in terms of area and charges explicitly, so we are unable to find the analogue of Smarr’s formula (12).

2.3. Thermodynamical quantities derived from the metric

We now determine the thermodynamical quantities in (10) using the metric. The temperature \( T \) is related to the surface gravity \( \kappa \) by

\[ 2\pi T = \kappa = -\frac{1}{2} \frac{dg_{tt}}{dr} \bigg|_{r=r_e, \theta=0}, \]

using the metric

\[ \frac{r}{\sqrt{\Delta}} \bigg|_{r=r_e, \theta=0} \frac{dg_{tt}}{dr} = -2(r_+ - m), \]

where

\[ \sqrt{\Delta}_{r=r_+, \theta=0} = 2m(K + \sqrt{m^2 - l^2}L) = \frac{S}{8\pi}. \]
The first law of black-hole thermodynamics (16), which is in agreement with the first law (10).

The angular velocity of the black hole at the outer horizon is:

\[
\Omega \equiv \left. \frac{-g_{t\theta}}{g_{\theta\theta}} \right|_{r=r_+, \theta=0}.
\]

From the metric (2) we can write

\[
\frac{g_{tt}}{g_{\phi\phi}} = \frac{r^2 - 2mr + l^2 - l^2 \sin^2 \theta}{2ml \sin^2 \theta (rL + mL - mL)}.
\]

At the horizon, which means that \(r^2 + l^2 - 2mr = 0\), so

\[
\frac{g_{tt}}{g_{\phi\phi}} \bigg|_{r=r_+, \theta=0} = \frac{-l}{2m(\sqrt{m^2 - l^2} L + mL)} = \frac{-8\pi l}{S},
\]

which is also in agreement with the first law (10).

3. Black holes in five dimensions

3.1. Metric and physical parameters

The metric for five-dimensional rotating charged black holes of toroidally compactified string theory, specified by the ADM mass \(M\), three charges \(Q_1, Q_2, Q_3\) and two rotational parameters \(l_1, l_2\), is given by [4]:

\[
d^2 s^2 = g_{tt} \, dt^2 + g_{rr} \, dr^2 + g_{\theta\theta} \, d\theta^2 + g_{\phi\phi} \, d\phi^2 + g_{t\phi} \, d\phi \, dt + \Delta \, d\psi^2 + \Delta \, d\psi^2,
\]

where

\[
g_{tt} = -\Delta^{-2/3} \left( R(R - 2m) \right),
\]

\[
g_{rr} = \Delta^{1/3} \frac{r^2}{(r^2 + l_1^2)(r^2 + l_2^2) - 2mr^2},
\]

\[
g_{\theta\theta} = \Delta^{1/3},
\]

\[
g_{\phi\phi} = \cos^2 \theta \sin^2 \theta \Delta^{-2/3} (L_1 k_3 + L_3 k_1),
\]

\[
g_{t\phi} = -2m \Delta^{-2/3} (l_1 R c_1 c_2 c_3 + l_2 (2m - R) s_1 s_2 s_3),
\]

\[
g_{\phi\theta} = -2m \cos^2 \theta \Delta^{-2/3} (l_1 (2m - R) s_1 s_2 s_3 + l_2 R c_1 c_2 c_3),
\]

\[
g_{\psi\phi} = \sin^2 \theta \Delta^{-2/3} \left[ \Delta + \sin^2 \theta (L_1 k_1 + L_2 k_2 + L_3 k_3) \right],
\]

\[
g_{\psi\psi} = \cos^2 \theta \Delta^{-2/3} \left[ \Delta + \cos^2 \theta (L_1 k_1 - L_2 k_2 + L_3 k_3) \right],
\]

(22)
where

\[ L_1 = l_{12} + l_{22}, \]

\[ L_2 = l_{12} - l_{22}, \quad L_3 = 2l_{12}, \]

\[ k_1 = mR - 2m^2q - 4m^2t, \]

\[ k_2 = R^2 + mR + 2mRp + 2m^2q, \]

\[ k_3 = 4m^2c_1c_2c_3s_1s_2s_3, \quad R = r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta, \quad p = s_{12} + \]

\[ s_{22} + s_{32}, \]

\[ q = s_{12}s_{22} + s_{12}s_{32} + \]

\[ s_{22}s_{32}, \quad t = s_{12}s_{22}s_{32}, \]

and \( s_{i,c} \) stand for \( \sinh \delta_i, \cosh \delta_i \) (i = 1,2,3), respectively.

Electromagnetic vector potentials are given by:
The first law of black-hole thermodynamics

\[ A^{(1)}_{r1} = \frac{m \cosh \delta_1 \sinh \delta_1}{r^2 + 2m \sinh^2 \delta_1 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta}. \]

\[ A^{(1)}_{\phi 1} = m \sin^2 \theta \frac{l_1 \sinh \delta_1 \sinh \delta_2 \cosh \delta_3 - l_2 \cosh \delta_1 \cosh \delta_2 \sinh \delta_3}{r^2 + 2m \sinh^2 \delta_1 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta}. \]

\[ A^{(1)}_{\psi 1} = m \cos^2 \theta \frac{l_1 \cosh \delta_1 \sin \delta_2 \cosh \delta_3 - l_2 \sin \delta_1 \cosh \delta_2 \cosh \delta_3}{r^2 + 2m \sinh^2 \delta_1 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta}. \]

\[ A^{(2)}_{r1} = \frac{m \cosh \delta_2 \sin \delta_2}{r^2 + 2m \sinh^2 \delta_2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta}. \]

\[ A^{(2)}_{\phi 1} = m \sin^2 \theta \frac{l_1 \cosh \delta_1 \sin \delta_2 \cosh \delta_3 - l_2 \cosh \delta_1 \cosh \delta_2 \sin \delta_3}{r^2 + 2m \sinh^2 \delta_2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta}. \]

\[ A^{(2)}_{\psi 1} = m \cos^2 \theta \frac{l_1 \cosh \delta_1 \sin \delta_2 \cosh \delta_3 - l_2 \cosh \delta_1 \cosh \delta_2 \sin \delta_3}{r^2 + 2m \sinh^2 \delta_2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta}. \]

\[ B_{r\phi} = -2m \sin^2 \theta (l_1 \sinh \delta_1 \sinh \delta_2 \cosh \delta_3 - l_2 \cosh \delta_1 \cosh \delta_2 \sinh \delta_3) (r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta) + 2m \sinh^2 \delta_1 (r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta + 2m \sinh^2 \delta_2)]. \]

\[ B_{r\psi} = -2m \cos^2 \theta (l_2 \sinh \delta_1 \sinh \delta_2 \cosh \delta_3 - l_1 \cosh \delta_1 \cosh \delta_2 \sinh \delta_3) (r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta) + 2m \sinh^2 \delta_1 (r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta + 2m \sinh^2 \delta_2)]. \]

\[ B_{\phi \psi} = \frac{2m \cosh \delta_1 \sinh \delta_3 \cos^2 \theta \sin^2 \theta (r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta + m \sinh^2 \delta_1 + m \sinh^2 \delta_2)}{(r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta + 2m \sinh^2 \delta_1) (r^2 + l_1^2 \cos^2 \theta + l_2^2 \sin^2 \theta + 2m \sinh^2 \delta_2)]. \]

\[ 1 = R^3 + 2mpR^2 + 4m^2qR + 8mt \]

\[ r_+^2 = m - \frac{1}{2}L_1 \pm \frac{1}{2} \sqrt{L_1^2 + 4m(m - L_1)} \]

and we choose \( G_N = \frac{1}{4} \pi \).

The physical quantities: ADM mass \( M \), three charges \( Q_1, Q_2, Q_3 \) and two angular momenta \( J_1, J_2 \), are given by

\[ M = 2m (\cosh^2 \delta_1 + \cosh^2 \delta_2 + \cosh^2 \delta_3) - 3m, \]

\[ Q_1 = 2m \cosh \delta_1 \sinh \delta_1, \]

\[ Q_2 = 2m \cosh \delta_2 \sinh \delta_2, \]

\[ Q_3 = 2m \cosh \delta_3 \sinh \delta_3, \]

\[ J_1 = 4m (l_1 \cosh \delta_1 \cosh \delta_2 \cosh \delta_3 - l_2 \cosh \delta_1 \sinh \delta_2 \sinh \delta_3), \]

\[ J_2 = 4m (l_2 \cosh \delta_1 \cosh \delta_2 \cosh \delta_3 - l_1 \sinh \delta_1 \sinh \delta_2 \sinh \delta_3), \]
m is the non-extremality parameter, $\delta_{1,2,3}$ are the boost parameters and $l_{1,2}$ are the angular momentum parameters.

3.2. The first law of black-hole thermodynamics

The entropy is given by [3]:

$$S = 4\pi m \left[ \sqrt{2m - (l_1 - l_2)^2} \right]$$

$$dS = \hat{\Gamma}_1 dQ_1 + \hat{\Gamma}_2 dQ_2 + \hat{\Gamma}_3 dQ_3 + \hat{\Gamma}_4 dM + \hat{\Gamma}_5 dJ_1 + \hat{\Gamma}_6 dJ_2.$$  \hfill (28)

The first law is of the form

$$dM = T \, dS + 8_1 dQ_1 + 8_2 dQ_2 + 8_3 dQ_3 + \cdot \cdot \cdot dJ_1 + \cdot \cdot \cdot dJ_2.$$  \hfill (29)

Once again, we need to invert a Jacobian matrix and find the derivatives of solution parameters with respect to the physical parameters, because we cannot invert the algebraic equations in (27) and find the solution parameters explicitly. The details are in appendix B.

The result of this calculation is:

$$T = \frac{\alpha \beta}{S},$$

$$\Phi_i = \frac{S_i}{S} \quad (i = 1, 2, 3),$$  \hfill (31)

$$\Omega_1 = -\frac{\beta (l_2 - l_1) - \alpha (l_1 + l_2)}{S},$$

$$\Omega_2 = -\frac{\beta (l_1 - l_2) - \alpha (l_1 + l_2)}{S}.$$  \hfill (32)

where

$$\alpha = \sqrt{2m - (l_1 - l_2)^2},$$

$$\beta = \sqrt{2m - (l_1 + l_2)^2}.$$ \hfill (33)

3.3. Thermodynamic quantities derived from the metric

Now, we make an independent check of the coefficients in the first law. Using the metric, we can calculate $\Omega_1$,

$$\Omega_1 \equiv \left. \frac{\delta \theta}{\delta \phi} \right|_{r = r_+, \theta = \frac{1}{2}\pi},$$

$$= \frac{R(R - 2m)}{-2m \sin^2 \theta (l_1 Rc_1 c_2 c_3 + l_2 (2m - R) s_1 s_2 s_3)}.$$  \hfill (34)

where $R = \frac{r^2 + l_1^2 \cos^2 \theta}{r^2 + l_1^2 \sin^2 \theta}$.

$$R = -\frac{[\beta (l_2 - l_1) - \alpha (l_2 + l_1)] l_2}{\alpha - \beta}, \quad R - 2m = \frac{[\beta (l_2 - l_1) - \alpha (l_2 + l_1)] l_1}{\alpha + \beta}.$$
where
θ.

We consider the point on the outer horizon with,

θ

so

\[
\beta(\text{i}_2 - \text{i}_1) - \alpha(\text{i}_2 + \text{i}_1) = -2\pi S
\]

This result is in agreement with the first law (30) except for a numerical factor. We can repeat the calculation for \( \text{i}_2 \). It is also in agreement with the first law. Now, let us make an independent check for \( \kappa \), the surface gravity of the outer horizon [5]

\[
2\pi T = \kappa = \frac{1}{2}\sqrt{-g^{rr}g^{tt}} \frac{d\Sigma}{dr}_{r=r_+, \theta=\frac{1}{2}\pi},
\]

where

\[
\Sigma = g_{tt} - \frac{(g_{\phi t} + g_{\phi t})^2}{g_{\phi \phi} + g_{\phi \psi} + 2g_{\phi \psi} \phi \psi}.
\]

To find \( \kappa \), we need to calculate \( g^{rr}, g^{tt} \) and put 6 into some manageable form. The details of these calculations are in appendix B. The result is:

\[
\kappa = \frac{t_2^2 + 4m(m-L_1)}{\sqrt{\Delta + L_1 k_1 + L_2 k_2 + L_3 k_3}}.
\]

At the horizon, \( S = 4\pi \sqrt{1 + L_1 k_1 + L_2 k_2 + L_3 k_3} \), so

\[
\kappa = \frac{4\pi \alpha \beta}{S}.
\]

We can check the potentials \( \Phi_i \) for the special case \( \text{i}_1 = \text{i}_2 = 0 \). In this case, \( r^2 = 2m + \)

and.

4. Conclusion

Interpreting the surface area of a black hole as its entropy was one of the breakthroughs of black-hole thermodynamics. This made possible the analogy between the first law of black-hole mechanics \( dM = T \ dS + \alpha \ dJ + \gamma \ dQ \) and the first law of thermodynamics.

In this paper I calculated the temperature, angular velocity and the potentials that enter the first law for two different black holes from toroidally compactified string theory. I did this using the expression for entropy as a starting point and taking derivatives using the chain rule to make a change of variables.

Then, as a check, I calculated the temperature and angular velocity directly using the metric. The values found using the two different methods are in agreement.

Note that in four dimensions, we used the formula \( \kappa = -\frac{1}{2} \langle \text{d}g_{rr}/\text{d}r \rangle \), but in five
dimensions we have to use the more general formula
\[ \kappa = -\frac{1}{2} \sqrt{-g^{rr} g^{tt}} \frac{d}{dr} \left( g_{tt} - \frac{(g_{r\theta} + g_{\theta r})^2}{g_{\phi\phi} + g_{\psi\psi} + 2g_{\phi\psi}} \right) \Big|_{r_{\text{sur}}, \theta = \frac{\pi}{2}}. \]  

(App. 41)

**Appendix A**

Note that we can write \( S \) in the form

\[ K = \cosh \delta_1 \cosh \delta_2 \cosh \delta_3 \cosh \delta_4 + \sinh \delta_1 \sinh \delta_2 \sinh \delta_3 \sinh \delta_4 \]

\[ L = \cosh \delta_1 \cosh \delta_2 \cosh \delta_3 \cosh \delta_4 - \sinh \delta_1 \sinh \delta_2 \sinh \delta_3 \sinh \delta_4, \]

\[ S = 16\pi (m^2 K + m\sqrt{m^2 - l^2 L}), \] 

(A.1)

(A.2)

To determine the coefficients \( 0_i \), we have to invert the following matrix:

\[
\begin{pmatrix}
\frac{dQ_1}{dQ} & \frac{4mz_1}{w_1} & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
2 & 0 & 0 & 0
\end{pmatrix}
\begin{pmatrix}
z_1 & w_1 & 0 & 0 \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
2 & 0 & 0 & 0
\end{pmatrix}
\begin{pmatrix}
d\delta_1 \\
d\delta_2 \\
d\delta_3 \\
d\delta_4
\end{pmatrix}
\]

\[
\begin{pmatrix}
\frac{dP_1}{dJ} \\
0 & 0 & 0 & 0 \\
0 & 0 & 0 & 0 \\
1 & 0 & 0 & 0
\end{pmatrix}
\begin{pmatrix}
4mz_1 & w_{11} & 4mz_2 & w_{22} \\
4mz_3 & w_{32} & 4mz_4 & w_{44} \\
M & 0 & 0 & 0 \\
8mL & 8mL & 8mL & 8mL
\end{pmatrix}
\begin{pmatrix}
d\delta_1 \\
d\delta_2 \\
d\delta_3 \\
d\delta_4
\end{pmatrix}
\]

(A.3)

where

\[ w_i = \cosh 2\delta_i, \]

\[ z_i = \tanh 2\delta_i, \]

\[ \hat{M} = \frac{M}{m}, \]

\[ L_i = \frac{\partial L}{\partial \delta_i} \quad (i = 1, \ldots, 4). \]

(A.4) The result is
The first law of black-hole thermodynamics

where

\[
\begin{pmatrix}
\frac{d\delta_1}{dl} \\
\frac{d\delta_2}{dl} \\
\frac{d\delta_3}{dl} \\
\frac{d\delta_4}{dl} \\
\frac{dm}{dl}
\end{pmatrix} = \frac{1}{B} \begin{pmatrix}
\frac{B}{4m\nu_1} + z_1^2 & z_1 z_2 & z_1 z_3 & z_1 z_4 & -z_1 & 0 \\

\]

\times \begin{pmatrix}
\frac{dQ_1}{dl} \\
\frac{dQ_2}{dl} \\
\frac{dP_1}{dl} \\
\frac{dP_2}{dl} \\
\frac{dM}{dl} \\
\frac{dJ}{dl}
\end{pmatrix}

(A.5)
where
\[ u_i = -z_i P_L + 2 z_i L - \frac{1}{4m \omega} L_i B \] (i = 1, \ldots, 4),

(A.6) Now, using this matrix, we can calculate the 0,’s defined in (9)

\[ P_L = L_1 z_1 + L_2 z_2 + L_3 z_3 + L_4 z_4, \]
\[ B = 2 M - 4m (w_1 z_1^2 + w_2 z_2^2 + w_3 z_3^2 + w_4 z_4^2). \]

\[ \Gamma_5 = \frac{S}{4 \sqrt{m^2 - l^2}}, \]
\[ \Gamma_6 = \frac{-2 \pi l}{\sqrt{m^2 - l^2}}, \]
\[ \Gamma_i = \frac{-S_i}{4 \sqrt{m^2 - l^2}} \quad (i = 1, \ldots, 4), \]

where
\[ T = 1/0_5, \]
\[ \Box = -0_5 0_5, \]
\[ S_i = -0_i 0_5 \quad (i = 1, \ldots, 4) \]

and \( S_i = \partial S/\partial \delta_i. \)

Appendix B

Appendix B.1. Finding the 0’ s

To find the derivatives of boosts with respect to physical variables (\( \partial \delta_1/\partial Q_2 \) etc) we need to invert the following matrix:

\[
\begin{pmatrix}
\frac{dQ_1}{dQ} & 2m \omega_1 \\
\frac{dQ_3}{dQ} & 2m \omega_2 \\
\frac{dM}{dQ} & 2m \omega_3 \\
\end{pmatrix}
\begin{pmatrix}
0 & 2m w_2 & 0 & z_2 w_2 \\
0 & 0 & 2m w_3 & z_3 w_3 \\
0 & 0 & w_0 + w_1 + w_2 & \Box \\
\end{pmatrix}
\]

\[
\begin{pmatrix}
0 & 0 \\
0 & 0 \\
\end{pmatrix}
\]
The first law of black-hole thermodynamics

\[ dJ = J_1 dJ_1 + J_2 dJ_2 + J_3 dJ_3 + J/m dJ/m - 4mE + 4mC \]

where
\[ dJ_1 = J_1 2_{11} + J_1 2_{22} + J_1 2_{33} + J_1/m dJ_1/m - 4mE + 4mC \]

\[ d\delta_1 d\delta_2 d\delta_3 \]

\[ \times \frac{\partial^3}{\partial \delta_1^2 \partial \delta_2 \partial \delta_3} \quad (B.1) \]

\[ dl_1 dl_2 w_i = \cosh 2\delta_i \]

\[ (i = 1, 2, 3), \]

\[ z_i = \tanh 2\delta_i \quad (i = 1, 2, 3), \quad (B.2) C = \cosh \delta_1 \cosh \delta_2 \cosh \delta_3, \]

\[ E = \sinh \delta_1 \sinh \delta_2 \sinh \delta_3. \]

The result is
\[
\begin{pmatrix}
\frac{d\delta_1}{d\delta_2}
\end{pmatrix}
= \begin{pmatrix}
\begin{bmatrix}
d + U \frac{z_2}{\omega_2} + z_2^2 & z_2 z_3 & -z_2 \\
\omega_3 & 2 m z_1 & 2 m z_2 & 2 m z_3 & 2 m
\end{bmatrix}
&
\begin{bmatrix}
1 & 0 & 0 & 0 & 0 \\
0 & 1 & 0 & 0 & 0 \\
0 & 0 & 1 & 0 & 0 \\
0 & 0 & 0 & 1 & 0 \\
0 & 0 & 0 & 0 & 1
\end{bmatrix}
\end{pmatrix}
\]

(B.3)
where
\[ U = (w_1 + w_2 + w_3 - w_1 z_1^2 - w_2 z_2^2 - w_3 z_3^2), \]
\[ P_E = E_1 z_1 + E_2 z_2 + E_3 z_3, \]
\[ P_C = C_1 z_1 + C_2 z_2 + C_3 z_3, \]
\[ h = (C - E)(C + E), \]
\[ a = \frac{E l_1 + C l_2}{h}, \]
\[ b = \frac{C l_1 + E l_2}{h}. \]
Using these results, we can calculate the \( \theta_i \) as follows:
\[ c = 2 l_1 + a P_E - b P_C, \]
\[ d = 2 l_2 + b P_E - a P_C, \]
\[ t_{si} = \frac{U}{w_i} (E_i a - C_i b) + z_i c, \]
\[ t_{ei} = \frac{U}{w_i} (E_i b - C_i a) + z_i d. \]
\[ \tilde{\Gamma}_1 = \frac{-S_i}{\alpha \beta}, \]
\[ \tilde{\Gamma}_4 = \frac{S}{\alpha \beta}, \]
\[ \tilde{\Gamma}_5 = \pi \left( \frac{l_2 - l_1}{\alpha} - \frac{l_1 + l_2}{\beta} \right), \]
\[ \tilde{\Gamma}_6 = \pi \left( \frac{l_1 - l_2}{\alpha} - \frac{l_1 + l_2}{\beta} \right). \]

Appendix B.2. Finding \( \kappa \)

We know that \( g^{rr} = g_{rr}^{-1} \) and \( g^{i \iota} = (g_{\phi \phi} g_{\psi \psi} - g_{\phi \psi}^2)/D, \) where
\[ D = \frac{\text{Det}(g_{ij})}{g_{rr} g_{\theta \theta}}. \]
\[ D = g_{\mu}(g_{\phi \phi} g_{\psi \psi} - g_{\phi \psi}^2) + 2 g_{\phi \phi} g_{\phi \psi} g_{\psi \psi} - g_{\psi \psi}^2 - g_{\phi \phi}^2 g_{\psi \psi}, \]
After some algebra, we find that
\[ D = \cos^2 \theta \sin^2 \theta [(2m - R)R + L_2 (\cos^2 \theta - \sin^2 \theta)(R - m) - L_1 m + L_2 \cos^2 \theta \sin^2 \theta] \]
\[ = -\cos^2 \theta \sin^2 \theta \left[ \frac{1}{r^3} \right. \]
\[ g_{\phi \phi} g_{\psi \psi} - g_{\phi \psi}^2 = \cos^2 \theta \sin^2 \theta \Delta^{-1/3} \left[ \Delta + k_1 L_1 + (\sin^2 \theta - \cos^2 \theta) k_2 L_2 \right. \]
\[ \left. + k_3 L_3 - \cos^2 \theta \sin^2 \theta L_2^2 (2m + 2mp + R) \right]. \]
We know that \( g^{rr} = g_{rr}^{-1}, \) so
\[ -g^{rr} g^{rr} = \Delta + k_1 L_1 + (\sin^2 \theta - \cos^2 \theta) k_2 L_2 + k_3 L_3 - \cos^2 \theta \sin^2 \theta L_2^2 (2m + 2mp + R) \]
\[ \frac{r^2}{\Delta^{2/3}} \]
Note that at the horizon, \( R = m - \frac{1}{2} L_2 + \frac{1}{2} \sqrt{L_2^2 + 4m(m - L_1)} \) and \( \Sigma = 0 \). We find

\[
\kappa = \frac{\sqrt{L_2^2 + 4m(m - L_1)}}{\sqrt{\Delta + L_1 k_1 + L_2 k_2 + L_3 k_3}}.
\]
Acknowledgments

I would like to thank Mirjam Cvetic for giving me the idea, expanding it through stimulating discussions, for her guidance, helpful comments and her interest throughout the work. I would also like to thank Finn Larsen and Metin Gurses for helpful suggestions. This work was supported by the BDP program of TUBITAK (Scientific and Technical Research Council of Turkey).
